SUMMARY

Founder and operator who turns ideas into working products and automations using AI — without a traditional engineering background. I founded and ran a multichannel consumer brand end to end, then used AI tools to build the system that operated it (content, a WhatsApp assistant, a B2B CRM, competitive intel) and sold and deployed that system to an external client for USD 3,000. I understand the business and I ship — a combination most candidates only have one half of.

My edge is speed and judgment: I direct AI tools to take an idea to a live, in-production product in days, and I bring real operator context — what to build, why it moves a P&L, and how to take repetitive work off a founder's plate. I'm an operator who uses AI to build and run things, not a software engineer, and I'm direct about exactly where that line is.

Async-first, fluent in written English, comfortable on calls. Available immediately, looking for remote work in USD.

SKILLS

AI operations & automation: Workflow automation and process automation for operations · Building internal tools and AI agents by directing AI tools (vibe coding / prompt-driven) · No-code / low-code system design · AI content generation, lead sourcing/scoring, and reporting pipelines · Idea-to-shipped-product in days

Business & growth operations: Multichannel ecommerce operations (D2C, marketplace, wholesale, messaging, social) · WhatsApp commerce: sales, support, automated customer journeys · Email marketing as a hands-on Klaviyo user · B2B / wholesale sales and pipeline ownership · Growth direction: strategy and budget ownership (directs paid-media operators, does not pace ads) · Brand building · ANMAT/INAL food regulatory compliance

Ways of working: Founder's associate / chief-of-staff style ownership · Cross-functional and stakeholder coordination · Async-first communication and clear written docs / SOPs · Prioritization and shipping under constraint

Tools & domain: Shopify · MercadoLibre · WhatsApp Cloud API · Klaviyo · Instagram · Google Sheets · AI tooling for ops, content, and customer-facing automation · Functional foods / CPG, multichannel retail

EXPERIENCE

Founder & Operator — Smart Foods Argentina

2023 – 2026

Founded and ran Argentina's first ANMAT/INAL-certified adaptogenic functional-foods brand, operating across five sales channels: Shopify D2C, MercadoLibre, B2B wholesale, WhatsApp commerce, and Instagram.

- Owned the full business: product, brand, pricing, channels, sales, and operations across five channels
- Built and worked a 665-lead B2B wholesale pipeline (sourced and scored with AI) and closed mayorista (wholesale) accounts from it
- Ran multichannel ecommerce operations and customer communications across D2C and marketplace
- Directed growth strategy and budget; set direction for the operator handling paid media (did not pace ads myself)
- Achieved and maintained ANMAT/INAL food certification
- Automated daily operations so the business ran with little manual work: a daily Instagram post published with no human in the loop, and WhatsApp journeys that handled customer questions and cart recovery without a person
- Closed the brand in 2026 after a regulatory and market shift; now focused full-time on AI-native operator work

SmartBrain — operations platform, built with AI tools (no traditional engineering background), sold to an external client

- Conceived and built a multi-tenant operations system by directing AI tools, with no engineering background — connecting commerce, messaging, and email into one system that ran the business day to day
- Set up and ran a WhatsApp AI assistant, a B2B CRM, and competitive/market intelligence — all live in production
- Sold and deployed it to an external client (Korean Root) for USD 3,000 — outside validation that the product, not just the idea, works
- Ran it for my own brand plus two others, including one paying external client — proof that a non-engineer can ship and sell working AI software

PROJECTS

- Browser games & web apps — multiple playable browser games and small web apps conceived and shipped in days each by directing AI, as evidence of idea-to-product throughput
- Operational automations — AI-driven content generation, WhatsApp customer journeys, lead sourcing/scoring, and reporting pipelines built to run a real business day to day
